Thread: [Black screen in BIOS, HDD randomly 100%, Kaspersky uninstall itself.](#)

beam2546 - March 29, 2018, 2:31 am

Main problem (Can't solve)

- BIOS black screen on Samsung S23C350H but not on TV.
- HDD randomly 100% with only 1 MB/s usage.
- Kaspersky uninstall itself without my permission. AVP.exe still in my computer but can't use anymore.
- CS:GO FPS drop from ?300 to ?90 with same config. Same resolution. Change resolution don't help.

Bonus problem (Solved. Can happen again.)

- Stuck at 1024x768 (Solved by make custom resolution on nvidia)

Looks like you have a Bitcoin I have a few questions:

- Did you download pirated programs?
- Did you download Programs from untrusted sources? (Place that are not: Steam, Origin, Adobe etc..)
- Did you have random shutdowns with your internet?

Secondly, run an offline Scanner: Go to windows defender > Virus & threat Protection > Advanced scan > Windows Defender Scanner offline > Scan now

Your computer should restart and offline scan, just let windows do his work.

I think you mean a bitcoin miner, and I don't think you can figure that out from what he said above. There are lots of things it could be (could be part of a botnet, could have some bloatware, etc).

@OP I'd wait for someone to come in here and read from FRST logs. If you're familiar with Farbar's Recovery Scan Tool, then go ahead and post your logs, if not then wait a little and somebody should come in and ask you for them (and show you how to).
