Thread: Testing a binded and crypted Keylogger file

amshriaz96 - *April 4, 2018, 9:29 am*

I need a clear understanding of when I bind and crypt a Keylogger file, how will I test the keylogger file ? The reason I wanted to test a Keylogger file after binding and crypting because I want my keylogger file binded with jpg and mp3, so when my Victim opens the file they are only going to open the jpg and mp3 file without having to be asked to run the Keylogger which supposed to run the keylogger file hidden, which is known as run time Crypter. Bad binders and cypters won't do the runtime process properly and it is not FUD by most antiviruses. So how will I test out my Keylogger file after binding and crypting ? Which best crypter should I use that work as best runtime crypter and full FUD and its download to link to its software ?

Thank you!

Crypting it for runtime just means it would be detected by AV's not that it will be completely silent.

As far as testing goes you can use a VM

What is VM? is it a website or software ? But I need help building a fully undetectable crypter and how do I do that or modify runtime crypter to not get detected by AV's ?

Virtual Machine. There are some hosted on websites or you can download software lie vmware or virtualbox

There are a few threads on here on how to create your own crypter. Use the search function and do some research. I've never tried myself so I can't really help with anything more specific than that

Are you sure if I test run a keylogger on those virtual boxes will my computer get effected ?

And do you also know which legit crypter software should I use which will make my keylogger FUD? Do you know any legit free crypter software's ?

Lol legit free FUD crypters

Just kidding! you are in luck

Check out cassandra.pw, you have to PM Lexus for an invite though.

And also nothing will happen to your host as long as the VM is isolated
