Thread: [Stuck with bash script](#)

Domyos - April 24, 2018, 2:11 am

Hey guys,

so i'm creating a script that automates the creation of a website & adding a ftp user & mysql user. The problem i'm having is whenever i pass the password to the docker container, the password will never be fully in the config file.

example: <https://gyazo.com/1f1ad56c59e98ce833e99ab75656440d>

How can i make the script ignore all the \$ symbols in the password to make it work?
Its probably not the best way to do it but heres what i got to create it

Code `pass=$(openssl passwd -1 ${password})`
 `docker exec ftp-server sh -c "echo ${user,,}:\${pass} >> /conf/vsftpd/virtual_users"`
It ignores the first \$, but not the other ones.

I hope that someone can help me out.

Thanks

The problem could be in "\\$" as it forces to always print "\\$" as symbols.

Even if i remove the \ i still have the same problem, it then even gives empty passwords

Make sure you assign user variable.
