Thread: [How to spy for FREE, completely free, on an android device.](#)

Un1d3ntified - June 26, 2018, 9:32 am

To spy on an android device is very easy:

step one - go to this domain (spyhuman.com) and sign up for an account.

step two - go the same domain on the android device you want to spy on and download the apk service file.

step three - open the file and follow the instructions.

step four - go back to any other device and go and sign into the account and there you have it, you are able to see everything on there phone.

PM me for more information.

Is this file persistant? Because other MSF is sufficient.

Ah as you appear to be promoting a site on post 1. I guess you have joined to promote your product.

That doesn't really make it anymore credible either.

No, i dont have anything to do with the website, i just wanted to help people out if they wanted to know about it and yes the file is persistent.

if the device is turned off or rebooted the file will stay on the android. The file is also hidden on the phone so user has no idea.

OK thank you for the information. It will be worth taking a look and testing out.

Have you tried it yourself and are you sure the APKs arent also backdoored?

What proof do you have that someone else can't also access everything on the device? That's the important question here. Nobody should dare install this on any phone until there is verifiable proof that there is not a back door for someone else to walk on in through.

This program isn't the real deal, if u want to be able to hack into a phone and trace its tracks and do all the illegal stuff you wouldn't use this application. However if we're thinking about tracking your kids, seeing if their being bullied, this is the perfect tool to use. And yes there is still a possibility that it can be breached but for the sake of what it does it's only temporary.

PM me for more information.

Paaax1203 - June 28, 2018, 1:41 am

very interesting, thank you

I followed the instructions and signed up, but can't see any device. Can you give me more highlights?

You need to have the target device, go to the same website and login into the account... click the download APK button and continue the installation

You will only need the target phone for maximum of 3 and a half minutes if you are quick.

Ohh sorry if that was unclear but yes, its almost like installing the payload onto the device.
