Thread: [Vb.net - access database](#)

Uija - July 21, 2018, 8:42 am

Hello everyone ,
at the beginning of my program you have to register. But what if the username already exists?I already wrote something , but It does nothing ? (when I click on the button it says nothing..)
Can someone say me what did I wrong ?

My code :

```
Imports System.Data.OleDb
Public Class Form1
```

```
Dim boolUsernameExists As Boolean = False
```

```
Private Sub FlatButton1_Click(sender As Object, e As EventArgs) Handles FlatButton1.Click
```

```
Dim strUsername As String = FlatTextBox1.Text
```

```
Try
```

```
    If String.IsNullOrEmpty(strUsername) Then
```

```
        Return
```

```
    End If
```

```
    Using dbConnection As OleDbConnection = New
```

```
OleDbConnection("Provider=Microsoft.Jet.OLEDB.4.0;Data
```

```
Source=|DataDirectory|\bin\Debug\Arbeiter.mdb")
```

```
        dbConnection.Open()
```

```
        Using dbCommand As OleDbCommand = New OleDbCommand("Select Count(*) FROM
Arbeiter WHERE Forname LIKE?", dbConnection)  ' "Arbeiter" is the name of the table and
"Forname" is the username
```

```
        dbCommand.Parameters.AddWithValue("@p1", strUsername)
```

```
        Dim result As Integer = DirectCast(dbCommand.ExecuteScalar(), Integer)
```

```
        If result > 0 Then
```

```
            boolUsernameExists = True
```

```
            MsgBox("Username already exists")
```

```
        Else
```

```
        End If
```

```
    End Using
```

```
    dbConnection.Close()
```

```
End Using
```

```
If boolUsernameExists Then
```

```
    MsgBox("Username already exists")
```

```
    Return
```

```
End If
```

Catch ex As Exception

End Try

End Sub

aneeshkollam5 - July 22, 2018, 2:28 am

```
Using dbCommand As OleDbCommand = New OleDbCommand("Select * FROM Arbeiter WHERE  
Forname =" & strUsername & "'", dbConnection)
```

```
Dim dr As OleDbDataReader = dbCommand.ExecuteReader()
```

```
If dr.HasRows Then
```

```
    boolUsernameExists = True
```

```
    MsgBox("Username already exists")
```

```
Else
```

```
End If
```

New OleDbCommand("Select * FROM Arbeiter WHERE Forname =" & strUsername & "'",
dbConnection)

```
Dim dr As OleDbDataReader = dbCommand.ExecuteReader()
```

```
If dr.HasRows Then
```

```
    boolUsernameExists = True
```

```
    MsgBox("Username already exists")
```

```
Else
```

```
End If
```

Thank you ! This works ?
