Thread: [Installing outdated LAMP on Ubuntu](#)

BlackSn0w - July 22, 2018, 2:55 am

Hey there!

I need to setup an Ubuntu VM with LAMP that is intentionally outdated and vulnerable for testing purposes.

It has to run Ubuntu 12.04 or 14.04 and the following:

Apache 2.2.22

PHP 5.3.10

MySQL 5.5.54

I know how to traditionally setup LAMP on Ubuntu but I don't know how to install specific versions of outdated packages including their dependencies that are not supported anymore.

I have done my research, googled many hours but with no result that is why I ask for help.

Thank you ?

I would just get a really dated ubuntu minimal or net inst ISO and install that to a VM in virtualbox and then I would attempt to install the programs manually from tarballs of those specific versions or debian based packages for those specific versions. There was a place called Suse studio years ago that let you build your own distro with your own packages, perhaps that is a viable option for you. It allowed creation of the ISO image and download in minutes, and it was free. I do not know if this service is even still operational.

The proper way, if the packages are still in the repos is via pinning:

<https://wiki.debian.org/AptPreferences>
