Thread: [Software to analyze by yourself if something is infected](#)

Lykos Thrylos - July 24, 2018, 10:20 pm

Hello, I would like to download some softwares that would let me see what a software does once opened and such, so I can see by myself either something is a virus or not. I know this exists but I am not sure what to download for that. Thank you.

Download VirtualBox and use this image:

<https://developer.microsoft.com/en-us/microsoft-edge/tools/vms/>

For better security, make sure your VM is disconnected from the Internet

Also, if you want even more, take a look at this:

<https://www.fireeye.com/blog/threat-research/2017/07/flare-vm-the-windows-malware.html>

That's not what I asked for though, thanks nonetheless. I was looking for a software that would tell me what a file does once executed. I know that such software exists but I forgot the name.

EDIT: Found what I needed, locking the thread.
