Thread: [Remote Password Stealer that sends passwords via email](#)

Ineffable9876 - July 29, 2018, 11:28 am

I have been looking for a password stealer that I can send to someone, they open it, and then it uses something like ChromePass to get all the browser passwords stored on their computer and then sends it to my email. Does anyone know of something like this that is free and easy to use?

SysAdmin - July 29, 2018, 11:34 am

I've seen Keyloggers that do it send the logs via E-Mail. Most likely a RAT would be better sufficient with some sort of plugin.

Maybe this thread will help you out: [Keyloggers](#)

There are lot of various Keyloggers on HackForums and internet, not every keylogger has option to steal passwords from browsers, but there are some, you just need to search for them. But first learn something about them, because you will probably have to crypt them with some pretty undetectable crypter but mostly you will have pay for good and undetected crypter. But you can trick your enemy with Social Engineering for turning AV off. Next problem will be, mainly on Windows 10, Windows Defender and Windows Smart Screen but there are exploits to get around them.

More you will learn, more you will know. Welcome on HackForums

Use any RAT and then a little simple PowerShell script would get you what you want.

I just scribbled one out and it has 3 parts. (Before running, you have to upload the terminal version of Chromepass to your own filehost that you can wget from.)

1. Downloads and runs the file to output a list of passwords and usernames
2. Sends yourself an email using Google's SMTP server with the list mentioned before
3. Deletes every file/directory involved in stealing the password and cleans up. Exits after

I wrote this off the top of my head so forgive me if this needs a little tweaking to work.

[Here ya go. ?](#)

This definitely is possible to get working with other tools too, if they have the ability to output to a text file (to use for the email attachment).

Good luck, OP!

Might post this in it's own thread too.
