Thread: [\[FREE\]Crypto-Hijacker v1.1](#)

Leper1337 - August 8, 2018, 1:14 pm

First of all, hello to everyone on hackforums, this is my first public release so don't be too hard on me :

I present to you a program which is able to detect and change crypto-wallet addresses in the clipboard and it can be used to hijack transactions.

Since the transactions aren't reversible it's a good thing and if you get lucky you can make yourself a lot of money by using it.

I tested it personally on Windows XP, Windows 7 and Windows 10 and a several Server builds. I have always considered free software good, and this project wasn't so hard and I'm not specially proud of it, so I decided to make it free.

It currently supports BTC, LTC, XMR and ETH.

I haven't scanned it on nodistribute.com or any other website that doesn't distribute binaries to antivirus corporations because I couldn't find any.

It should be undetected with most antiviruses currently, but I still recommend using a crypter that supports VB.NET in which this project was written.

(Also I consider nodistribute.com to be an ESET honeypot)

I am not accountable for any damage done by this program, you can find the same text within the program itself.

I'll consider updating it by adding a built-in crypter or a selfspreading unit, or to support more cryptos.

Download: [mega.nz/#!72pjxbxZ!DRXOdDYoA9F3FNDNFX3PQnpYvE9rK9pRStGRAgN1Dh4](#)

(Note: The builder is clean, but if you're not sure run it in Sandboxie or in a VM)

Offical MD5 and SHA256 of files are in the changelog.

If you like the program please consider donating to:

BTC : 1BwxBu9ceBXp3z683maAwcuJFMcJxQFhc4

XMR :
