Thread: [Help with simple image overlay](#)

Sir-Teabag - August 12, 2018, 7:29 pm

I'm having trouble working this out, i'm thinking it'll use Javascript? Any help at all will be super appreciated

Anyway so on my index I have a question mark button, and I want it so when a user clicks that, instead of an image opening up or trying to download in a new tab I would like the image to be displayed with a little X button to close it, much like the HF alerts tab.

Like this, a simple overlay.

This is what I'm using so far

Code `<a href="metaexample.PNG" target="_blank" title="Click me for an example">`

Not really sure how to go about it all. Thanks if anyone can help! I hope it's not too much to ask ?

Never mind I think I finally got it on this

https://www.w3schools.com/howto/tryit.asp?filename=tryhow_css_modal

Looks like ass though

You'd use CSS:

Find the ID (id="xxx") or the class (class="xxx") of the X-div. Let's say its an ID (we use # for those, and a dot . for classes) and it's id="closemodal". Now the css (needs to be in a .css file or inside `<style></style>`-tags):

Code `#closemodal {`

`z-index: 999999`

`}z-index` 'layers' elements; so elements with a high z-index will be 'above' elements with lower (or default) z-indexes.

--

Sorry, misread your question. You're looking for a modal. I like remodal

<http://vodbears.github.io/remodal/> , but if you want a shinier one you can use

<https://sweetalert2.github.io/>

Create a wrapper element (position relative). The first child element is your content. Under the content you place your overlay (position absolute, width/height = 100%). To trigger display you could use JS or advanced CSS selectors, e.g. `#wrapper:hover + #popup {}` .
