Thread: [Loosing Connection](#)

turboaimer - August 14, 2018, 3:19 pm

Hey, I'm just loosing connection from people, They're not closing it in task-manager. I've tried NanoCore, Imminent Monitor, Quasar.. All of them just keeps disconnecting and i don't have the client anymore..

Could it be because the crypter is not stable?

Could it be because the crypter is not stable?

Maybe yes, you should try it on VM, and try to restart the VM couple of times to check if everything is good.

"Could it be because the crypter is not stable?" First off, are the clients' AVs picking it up? If not, make sure you're crypting your server correctly. Try to use the least amount of features you can in your crypter. Try your server on a VM with your antivirus off. If the client stays, it must mean that AVs were detecting your server. Even if you get good scantime results, your server might get detected when it runs.

If you still need help, feel free to PM me and I'll debug your problem for free.

it could be that your crypter is getting detected? maybe that the crypter breaks the stub at certain functions which causes it to crash?
