Thread: [Windows 7 Long Boot Process Problem - Boot Log Provided](#)

RawrWitMe - August 4, 2010, 12:25 am

Ok, so. When I start up my computer after it shows the windows logo with "Starting Windows" or "Loading Windows" (I forget.) I get a black screen for about a minute. I put on boot log and rebooted my computer. I looked at the log and, everything loaded correctly besides these.

```
Did not load driver \SystemRoot\System32\drivers\vga.sys  
Did not load driver \SystemRoot\System32\Drivers\NDProxy.SYS  
Did not load driver \SystemRoot\System32\DRIVERS\srp.sys
```

(Those weren't in that order, I just pulled the ones that had "Did not".) And ideas? I'm wondering what srp.sys and NDProxy.SYS is. I know what vga.sys is...I'm not that stupid. ;D. I just don't know how to fix it. I assume a corrupted driver but I don't know how to fix it. Thanks in advance.

The NDProxy.sys is a device driver for your network device.

Can you boot into Safe Mode at all? If so, hit a System Restore and see how you go from there. It seems like the aforementioned files are corrupted.
