lowfatcheeze - September 26, 2018, 8:43 pm

```
For p in password:
    if p == password:
        print('Nice...')
    else:
        pass
```

Hackoo - September 29, 2018, 8:12 pm

You can try something like this code from [here](#) :

PHP Code

```
<?php
import string, itertools
password = input("Enter password: ")
#password="abc"
characters = string.printable
def iter_all_strings():
    length = 1
    while True:
        for s in itertools.product(characters, repeat=length):
            yield "".join(s)
        length +=1

for s in iter_all_strings():
    print(s)
    if s == password:
        print('Password is {}'.format(s))
        break
```
