Thread: [Byte Crypter V3 & Quasar RAT - Help Needed](#)

Tactical Herpes - October 18, 2018, 6:40 pm

I'm currently using ByteCrypter V3 and Quasar RAT.

I've too many combinations of settings to list everything here, but the most important things are:

- I am only using installion/startup on one of the two, not both
- My non-crypted stubs work perfectly fine in Sandboxie on my own network (I have yet to try on another network because I can't get a crypted stub working properly)
- Crypted stubs don't give any errors when being ran in Sandboxie, but sometimes I get a pop-up titled 'Wirelessmon'
- Quasar has a .net dependency

I've little to no clue as why my crypted stubs don't work, but I'm hoping somebody else out there has this combination of crypter and RAT and can shine some light on this for me.

Thanks for any and all help.

So your crypted stub is working but not working on Sandboxie?

Try to uncheck everything on the crypter builder and test it.

EDIT:

you should post here [Cryptography, Encryption, and Decryption](#)

I just helped someone dealing with similar issues. Try leaving the stub blank and enabling startup/installation on crypter. Also, change the injection method, as I believe some of them on that tool don't work. Hope this helps.
