Thread: [Build an .exe from visual studio ?](#)

pmtobefriend - October 24, 2018, 7:10 pm

So I made a program using libcurl, (as a dynamic library)
I build it, ctrl + f5 , the program works and all.

so I go to the same place in my folder, open it, and get that error.

What I'm missing ? ?

EDIT ; something wrong in my code caused this, figured it out.

Try compiling for x86 and comment on the friend result to help you.

Also if you can compile in Release mode instead of Debug mode we can also see more details.

It seems an error with type of platform that you select.

I built it for x64 so its why im using x64

I compiled it for x86 and tried the same, it seems to be worst, since even on visual studio I cannot open it. while on x64, I could open it through visual studio.

edit ; actually does on both now rip... tryna figure out
