Thread: [Spynote5.0 issues](#)

Crazyer - October 28, 2018, 11:45 am

Hi guys, I tried spynote 5.0, it works really well (I just hope it does not have backdoor), and I have 2 questions:

1) the tool works perfectly and I have full access to the device, the problem is that I am interested in especially reading the conversations whatsapp.

when I try to find them from the documents I find the encrypted files.

I was wondering if there is a way to read conversations without having to download and decrypt them (I would have trouble recovering the key).

2) I use [censored], can I pass the traffic coming from the phone through this vpn? I have problems because if I use the vpn the door seems closed.

Thank you!

you can't read whatsapp messages unless you get the key . if the targeted device has no root , then forget about reading whatsapp messages (as far as spynote is concerned).

[censored] doesn't support portforwarding.

yes , whatsapp is not fully secured , there are still gap to ditch onto . The only advice i give you , is never trust paid softwares that claim the ability to read whatsapp messages (as for me haven't seen any of them working) . GL
