I mean, it's not a dedicated service or anything, but you could always do it yourself using this:

Just be sure to post a comment to keep the threat alive ?

You can find mass-mailer services online for purchase. as well as email leads (mailing lists). Just do a quick google search.

You can also Google Leaf PHP Mailer. Its free but you need to host it yourself.

i think its not possible to send email with attachment via php mailer!

spreading malware via mailspam is NOT easy, its a very hard way to get attachment-mails INBOX.

actually is also a problem, to spread infected direct links via mailspam, cause the v86 version of chrome is very paranoid.

im not a expert, im a newbie - but i tried many options to spread via mailspam and i got a lot of problems

i usually use [King Corso](#) , he is fast and all get into inbox.
10/10 service.
