Thread: [Google Chrome Browser Issue - Paying 100+ bytes for help](#)

IBotnet - November 1, 2018, 10:07 am

Title says it all.

I am currently having some random issue with Google Chrome. It started 2 days ago and when I launch Chrome, it launches the application but it won't let me see the window. The process starts, if I click the top right of my desktop background, it will close the window, but it's invisible.

To anyone who's able to resolve this over Join.me or Teamviewer, I will reward with over 100 bytes.

PM me or post if you're able to help, thanks. ?

I can give a try to help out if the problem persists. PM me your contact details. Also, can you drop some screenshots which might help to understand the problem?

Use ProcExp from the Sysinternals Suite, and look for a child process of chrome.exe. That should get you started on what process is being launched. Hell, even the Task Manager in Windows 8+ should be able to tell you that (Processes tab, click on the little arrow by Google Chrome to see the child processes).
