Thread: [man in the middle attack bypassing hsts new method?](#)

EIP - November 5, 2018, 11:46 am

For many websites such as facebook,google man in the middle attack with arpspoof and sslstrip does not work. It is more hard, if users use modern browser like chrome or firefox.

Do you know any other methods?

we literally had a thread about this less than a month ago. you could mitm the ssl cert too. you use one certificate pretending to be the server's certificate when communicating with the client. and use a separate one when pretending to be the client (communicating with the server.)
