Thread: [hacking someoneS phone that connected to your wifi network ?](#)

amirfredj - November 7, 2018, 5:23 am

hello !!!

can u anyone tell me plz if there is an easy tut or a software that can hacks someoneS phone(android or iphone) that connected to your wifi network ?
thanks in advance ?

pasnger57 - November 7, 2018, 6:49 am

no such thing a "hacking software" you have tools and device vulnerabilities that can be exploited depending on the device in question

thx for ur reply but do you know any tut ? i ve been browsing and heard about mitm exploits and droidsheep and arp spoofing

pasnger57 - November 7, 2018, 6:56 am

consider how broad your question is and how specific each device is and how impossible it would be for me to explain to you what yo have to do for any one random device on such network
you have to 1st consider the device in question and what its flaws are and if you can exploit such flaws

2nd thing to consider is the users of such device and weather they are keen to its flaws and know how to protect oneself from you the savvy exploiter

this my help you decide <https://www.cvedetails.com/>

What are you trying to hack?

Vulnerabilities and exploit check a tutorial for metasploit

Sniffing and spoofing move on bettercap 2.0

<https://github.com/bettercap/bettercap/wiki>

Probably the second attack is easier.

github.

Probably the second attack is easier.

im trying to hack someoneS mobilephone that connected to my wifi network (he is noob he dont know nothing about technology)

i have acces to the router

and can u tell me what is the defference between metasploits and sniffing and spoofing and wich one easier and guarented i think to use metasploits i will need a linux system is that right ?

thx for ur reply

by the way about this bettercap does my phone need to be rooted that i can use it ?

pasnger57 - November 7, 2018, 7:31 am

considering its your network they are connection to you can simple force such users to install your app to use your network and would be bound to the "TOS" (no one reads small print) have any and all backdoors your looking for in the app your requiring for use

so do u think that i can create an apk that force the wifi users to install it on their phones ? or it belong to my internet provider ?

i don't know what your programming skills are but im give you options that are NOT illegal in the fact you can declare all point of entry / tricking a users to bereave its a ISP software my be infringement of sorts but descaling it outright for your own privet network is not

The difference explained easily : are you trying to keep the control of their phones, or stealing their web passwords? In both cases you can obtain both starting by one attack and moving to the other. If you own the network you can turn off the wifi, use a ethernet cable to connect your pc, make a free hotspot by linux and then move a dns spoof attack, which means: they think to visit Facebook/google etc instead they are on your fake sites. Or force them to download an apk if you wanna keep a backdoor even out of your network

Bettercap can probably run on a phone kali linux version. Never tried

If you dont own a pc or installing linux on you pc is annoying. Buy a raspberry pi really cheap

so do u know any easy tut here about rooting my phone android huwaei thanks

pasnger57 - November 7, 2018, 8:38 am

TOS acronym for "Terms Of Service"
