Thread: [choosing a vps and AMP Attack](#)

Kouta - November 8, 2018, 1:43 pm

were wondering what benefits u get for better hardware on a vps.

let's say ur using an ntp amp attack, what hardware would u go for (know this isn't the right place to ask but feel like most people in here would know)

what kinda amp attacks are used today since i heard that ntp is kinda dead now?
also would be great if u guys could post some sites that provide spoofing and scanning vps

What is a vps my friend? Is it like a botnet

If the server is stronger you can run faster Scan for the vuln lists and to run the threads for the attack.

I advise against using VPS, they are never of high quality and you will never have a guaranteed port.

I advise you instead of the dedicated more cpu and port bandwidth has and better.

To scan lists in amplification I suggest you always use the same host you use to make ddos attacks if you want maximum efficiency if you can not use a host that uses a datacenter near your host to make attacks. (blacklisted IP addresses that could send you abuse report)

NTP is not dead but we are almost there, in my opinion the best method in amplification is the CLDAP at this time.
