Thread: [two hard drives](#)

Blackhawke2002 - November 24, 2018, 1:23 pm

Hi guys and gals,

As I've taken in more info from the forum here, i've also started looking deeper into my computer and just what it's configuration is. One thing that's always puzzled me: I have two hard drives (C and D). C is where my OS runs, D is everything else...or at least that's my most basic understanding of it. However, my C drive is damn near full, all the time, and I'm hesitant to go in and delete files for fear of messing up my OS, having to re-install, etc. Can someone shed some light and the purpose of the double hard drive, and any tips to cleaning up the smaller C drive?

What other info is needed to help answer the question?

Just download Glary utilities and perform a disk cleanup.

You'll notice a big difference.

You may want to move your libraries like Documents and Downloads off your C drive. Depending on what's there, it may make a significant difference or not. Right click on the libraries in Explorer, choose Properties, go to the Locations tab, and hit Move. Give them a new home on your external.

The point of multiple drives is simply more storage space. In some cases it's also used for performance increases, but for the vast majority of users, a second drive is just extra storage.
