Thread: [Kali Linux Live persistence Vs. Kali Linux USB Persistence?](#)

Pseudonym_96 - November 26, 2018, 12:12 am

Hello,

I have made a persistent bootable USB with kali before, and I have always seen something along the lines of "Kali Linux USB Persistence", but now when I see the menu, I see something along the lines of "Kali Linux Live System Persistence". Whenever I follow the usual commands to mount/unmount my partition to the persistent partition, nothing sticks? Has the process changed? Did I download the wrong .ISO?

Any and all help appreciated because I am ripping my hair out currently.

You still need to before hand set up the persistence partition. (I use RUFUS myself makes life a bit easier)

<https://medium.com/@fatahnuram/creating-kali-linux-live-usb-with-persistence-a-simple-guide-54e3eb01b6aa>

(For the bald patches in your hair I make organic and all natural cat and dog toupees you get 1 bag of dog or cat hair and a stick of elmers glue) (My neighbor has a horse if you are allergic to both cats and dogs I can shave the horse or a homeless person)
