Thread: [\[Spotify\] Music player](#)

cardiak - December 14, 2018, 1:30 am

Hey

Recently found out that Spotify published Web Playback SDK that allows you to play full songs on your own site (instead of the 30sec preview clips)

So I decided to make small website that just plays one song from Spotify as POC.

The POC is available on:

<https://musicplayer.cypher.fi>

What it does:

The javascript uses [Spotify web API to create new player and authenticate](#) and then uses the web playback SDK (using ajax creates POST request to spotify api) to connect to that player and play the song specified in the POST data.

requirements:

Client ID from [From spotify developer dashboard](#)

User needs spotify premium account or otherwise the song wont play.

The source code is publicly available on [Github licensed under GPL v3](#) and the API/SDK references are available on [Spotifys site](#)

If I have time I will probably make it look better and add more features. Currently it just displays album picture and track name using the data provided by spotify.

The website is served using [Netlify](#)
