PHP Code

```
<?php
```

```
ShowWindow(Application.Hanndle,SW_HIDE);
```

get an idea from [here](#)

their are many ways to do this, the best is to write a program where the main portion isnt even a exe but a dll

im not sure if you did not understood his question right, because he asked to have his process hidden. Thats not acomplished by hiding windows.

I agree, may some sort of Source code would help this boy.

Joseph Ducreux - February 16, 2019, 6:49 pm

yes a reverse DLL injection works great.... i had found a vulnerability that allowed a dll to be sideloaded by microsoft security essentials and be executed with SYSTEM priviledges (required

admin to get files into the program files and manipulate them, also required further action using ICALCS and TAKEOWN but both could be ran from admin so basically was admin-only needed exploit when you get down to it.... when the virus was ran their was zero process running and even when security essentials executable was stopped or terminated the virus was still running despite zero process in task manager ;)
