AIRED MASS EMAILER

Send Mass Emails in Seconds!

ACCURATE SCALED SCREENSHOT

Overview:

Well gents, I'm excited. This is my first actual contribution to the forums ?

For those of you who might be curious as to what this program does: The AIRED mass emailer is essentially a bot that sends one email to how ever many email addresses that are provided by the user. This type of program is often referred to as a Mass Mailer, Email Bot, etc.

Features:

This program has a lot of things that make it special and effective, including:Stable/clean UI

Multi-threaded Message Execution

Raw Text / HTML email support

Sent email status

Source code included w/ download

A basic tutorial can be found in the archive when downloaded.

How do I download?

You can download AIRED from here:

https://mega.nz/#!eQUmTaqB!Bf2hO_lbTXNJvoELLkXLGxGivUmwbxgOK3y6geFiDT8

To extract the archive, you'll need the password:

Password Encrypted ---> bDJyc2dJR3ITMVgxajFTdGVzRElicTU1

How to decrypt password: BASE-64 > MEGAN-35 > ATOM-128

If you need help, shoot me a PM. I will not GIVE you the password, but show you how to decrypt on your own.

Comments:

I know that not everyone trusts downloading files from this site (I can't blame you) especially from

new members.

So [here](#) is a Virus Total scan of the main binary (aired_v5.7.0.exe):

MD5 Hash: f24661b2e1feb92a32e525b8f7911134

SHA1 Hash: 27994afa23f73ca37afdedee101b718382e19db5

I hope you guys enjoyed. Don't leech! Be sure to comment ?

elliott94 - December 21, 2018, 5:40 pm

I decrypted it very fast ;) Hope it's not a rat :)

Nah brotha, you're safe. And I'm glad ?

K3njii - December 22, 2018, 6:38 am

cool stuff bro, I'm not into sending a bunch of emails but I'd definitely use this if I needed to

Professional Hacker - December 22, 2018, 1:21 pm

Getting this program ASAP

IGODI - December 23, 2018, 10:57 am

i used it now and here is what i figured out

- 1- it just say sent without even connecting to smtp host
- 2- give fake successful sent
- 3- it crush after successful message appear

i didn't check the source this is while trying to program i have sent for yahoo,gmail,aol

I don't know if you checked the Tutorial.txt accompanied with this program, but it explains how some providers don't give third-party access, else it needs to be enabled, etc. So whatever your issue is, I'd be happy to help resolve it for you. I do know however, that this program 100% works. And yes, please check out the source code. There are sub routines coded for everything. Nothing is fake ?

here is the first problem

the port used here isn't SMTP port it's for MTA to MTA communication only the right port is 465 not 456 you should fix this i think or make it Standers Port's and Custom Ports

and program still freez i just telling you the problem to fix it ?

I actually feel kind of dumb for not noticing that. I used the port 587 for the testing. It looked flawless. I can't edit the thread, but I'll just have a mod close it for me and repost. Thanks ?
However as far as 587 and 25, it worked for me using Google Mail. I just had to enable less-secured-apps in the settings to enable third party access.
