Thread: [Looking for a RAT with Virtual PC capabilities.](#)

InvestorLogic - December 23, 2018, 2:16 am

I am looking for a RAT (Remote Administration Tool, or Remote Administration Trojan like some likes to call it) that has the capability of creating a secret virtual PC that the "victim" or computer user won't know about that would allow me to perform tasks within that virtual PC completely separate to whatever the user of the computer is doing on the computer and that they can't see what I am doing.

Picture a RAT like, for example: njRAT that allows you to explore files, download and upload files, see the webcam, hear the microphone, see the desktop screen, control the desktop remotely via mouse, but would have "Create Virtual Computer" as part of the menu choices

Example:

Menu:

Create a Virtual PC

|

->Define hard drive size (Host PC has 232 GB of free available space):__ GB

->Define amount of RAM to allocate to the virtual PC (Host PC has: 8 GB of RAM):_ MB

->Select ISO image to mount (to install OS): <Browse the victim's PC for an ISO image you get to remotely upload to any folder>_

->Define NIC interface MAC address:___

->Remote Desktop:

[->[] Use VNC to view and control this virtual PC. Port:_____

you know? Something like that..

I know that there has to be a RAT with such capability by this time, I did google it and couldn't find any, or perhaps I wasn't using the correct term and maybe its not know as a "RAT" or something. Googling it up only returns results explaining how to run a trojan inside a virtual machine/virtual box.

SIM-2875347 - December 23, 2018, 2:55 am

I think the closest thing you are going to get to that is HVNC. Some RATs have it already.

I.M.P - December 23, 2018, 6:13 am

Pretty sure all those features are in normal rats

sh4moon - December 23, 2018, 6:26 am

I don't know why you need to create a virtual machine. that would take up a decent amount of disk space and be not very low key.

? **BL4ZE** - December 23, 2018, 7:06 am

No you can't find this type of feature anywhere on internet but it is possible to do this, Coder has to learn hypervisor api or virtualbox api to do this magic

?**Apocalypse** - December 23, 2018, 7:16 am

This is ridiculous.

There's no purpose for this.

I.M.P - December 23, 2018, 7:22 am

No its not

its something like remote virtualbox manager

Angelis - December 24, 2018, 6:50 am

OP I read your thread, but heres where my logic lies.

First, you wanna do more work then required, why?

Secondly, it does not seem very well thought out. I dont want prison time, and Ive no idea what the hell happened last night. lol

I have tried njRAT (lots of versions, from the leaked source code to the one going as "Lime-Rat"), I have tried Nano Core, even Lumosity (the creation of server/stub doesn't work as that is dependent on the developer's license activation to create your stub for you, but all the other menus does work just enough to tell me all the capability of that RAT), I have tried a few other RAT's and none of them had such a feature to create a virtual PC. If you know of an example I would love to hear it.

(Dec 23, 2018 07:26 AM)sh4moon Wrote: [\[CITE\]](#) I don't know why you need to create a virtual machine. that would take up a decent amount of disk space and be not very low key.

Depending on the use case there are many advantages to running a virtual PC inside the victim's computer. With your very own virtual PC you can run VPN's, run advance software/implement your own solution, and best of all you can execute your LEGAL method of making money online where the more computers/hosts you have to your availability the more money you can make and no I am not talking about cryptocurrency mining at all. You can prepare your .vhd or .img hard drive image preloading everything you need and send that off to the remote computer to run it as a virtual PC instance (consider it your very own private Amazon EC2 solution) and no, I am not talking about anything illegal here, all that can be arranged with the permission of the computer owner and would still be alot cheaper than using Amazon EC2. Such a RAT with such a feature would no doubt be extremely useful.

You mentioned that it would take a decent amount of disk space, well there are lots of computers out there with massive amounts of disk space, with spaces much greater than 1 TB using 30 GB to run your own Windows 7 Instance or even 8 GB (or even 4 GB untra light) linux instance. the impact won't be felt at all by the user.

And lastly, this is something I would like to see, if none other than for the "hobby" for the yet another thing we can do with computers, very fun, interesting that we can use to show off, a concept, etc...

(Dec 23, 2018 08:06 AM)? BL4ZE Wrote: [\[CITE\]](#) No you can't find this type of feature anywhere on internet but it is possible to do this, Coder has to learn hypervisor api or virtualbox api to do this magic

I hope a coder forks over njRAT (open source) and implement those in the forked version, would be really cool to see the outcome of this.

CyberStrike - December 26, 2018, 3:26 pm

I read this and first thing I thought of was covert comms or covertness in general. Controlling a host from a guest .. remember that they are separate (at least without a VM escape which happens), yes some sharing does occur files/clipboard/drag and drop yet generally they are separate. Like yes using Hyper-V in Windows 10 Pro/Enterprise you have a generally on board hypervisor .. the real thing though is you would be needing to ensure WIndows 10 Pro/Enterprise and enable maybe use a boxstarter setup or something or even a DSIM. I personally would think that something very light weight would be the important thing.. Windows 7/8/10 embedded? (You now are looking at ~3.5gigs for a gui) You really want light weight solutions to do all of this. Honestly though controlling the host probably wouldn't happen unless let's say that you setup a pssession or a VNC on said host. Seeing that covertness is not the primary reasoning, you're basically paying for the same ground twice.

in which programming language you need this ? .Net or native ?

BigFatDogShit - January 17, 2019, 9:32 pm

You just want to be able to browse their files and execute programs/move/add/remove files without them seeing? So not Remote Desktop Control but what's another name for this folks? Because this exists?

Angelis - January 18, 2019, 5:48 am

Aside from this being pretty much completely pointless.

The Host machine would def. Notice the resources consumption.

Even the most dimwitted of users would realize something if fucky when their cup and memory are constantly maxed out.

BigFatDogShit - January 18, 2019, 8:21 am

You know the answer to this. Your attempts to conceal your multi are just terrible, also. ?

But to actually answer the question and not be a piece of Dog Shit ?

To do system functions without the users interaction or interference of user activity they want HVNC or Concurrent RDP abilities.

BigFatDogShit - January 18, 2019, 8:27 am

Listen you'd be surprise at how I really wasn't sure. ;-;

I'm trying to get all the terminology even down. A person on the Tor forum Dread even struggled with the terminologies for some of these things and joked and they know x1000 more than I.

InvestorLogic - February 20, 2019, 1:10 am

(Dec 27, 2018 05:36 AM)? BL4ZE Wrote: [\[CITE\]](#) in which programming language you need this ? .Net or native ?

Native. I would prefer to see a project like this in Native than .net but I would take .Net if given no choice.

Sorry for the late reply. I was out for a loooong vacation.

opsplayer - February 25, 2019, 11:53 pm

Sorry if this is gravdigging but just reading this made me think he wants to do fraud but cant say it. Wants to make it seem like it's for more simpler things or idk wut. "Private Amazon cloned vps stuff" I feel like the only solid answer is u want a vm to login to their amazon or Ebay or if they save their payment info use their card. Only logical explanation tbh.. if not cool. Regardless bad boy lel

Check out this: <https://hackforums.net/showthread.php?tid=5897941>

It's a native RAT with hidden RDP (which comes close to that you want, but if you do high-performance stuff, the user will notify anyway).
