Thread: [SiriTDecrypter \(VB.net\) - Teamviewer, Chrome, Opera, Safari, Filezilla, etc.](#)

SiriT - December 24, 2018, 2:55 am

Hi.

Today I would like to share my Credential decrypter for a bunch of applications.

I developed it with "obfuscator like" code, so that it cannot be read that good.

- Teamviewer (latest Version)
- Opera (latest version)
- Google Chrome (latest version)
- Filezilla (latest version)
- Safari
- Firefox (Version 42)
- Pidgin
- Trillian
- Paltalk
- Nimbuzz
- Internet Explorer (only .net Framework 4.5)
- Windows Key

- Opera older versions
- Google Chrome older versions
- MSN

Put a lot of effort in this code. Google Chrome also decrypts the passwords of ALL chrome profiles.

1.

Options, Imports and Call:

Code 'Option Strict On

'Option Infer Off

'Imports System.IO, System.Text, System.Runtime.InteropServices,

System.Text.RegularExpressions, Microsoft.Win32, System.Net, System.Security.Principal

'Private Sub Doit()

' Dim zez As New SiriTDecrypt

' zez.ReadAllInfos().ForEach(Sub(w)

' Console.WriteLine(String.Concat(w.ap, " ", w.ur, " ", w.ac, " ", w.pa))

' End Sub)

'End Sub

Here is the code (base64 encoded LINK as I cannot post links)

Why would you obfuscate "your own" open source code? Are you a retard?
