Thread: [Havij table data listed but cannot retrieve.](#)

vipervenombite - December 24, 2018, 7:24 pm

Can anyone please help me out with this? While using Havij 1.16 and 1.17 Pro, a table is listed several thousand entries, but when I get file..... nothing is listed... I also have strange encryption. I believe it might be java...here are a few strings: "B[3)pFc(/Cw.KAMN"; "g&{}9>c(y.9\$Hp gn"; "&`iB:M=vh8v]f;#"; " Bz[Gk*Jz60WA8l,Y". (without the " marks or ; separators"). I appreciate anyone expertise and experience and am grateful for any input. Thank You

This looks like a false positive.

Other than that, before using tools you should learn how to hack manually first.

Tools will always produce false positives and therefore require you to check manually, but if you don't understand the manual process, then you always will end up asking for help.

For the current case, you can try the same injection point with SQLmap.

Cheers, Gee.
