Thread: [How do I make .NET WebBrowser show reCaptcha?](#)

isu - December 25, 2018, 1:56 pm

Hey! I'm currently working on an account generator in .net.

The program will display a browser where the program automatically fills in the required data.

The only problem is Captcha. I can't make the WebBrowser display it. I can't see the field.

Is there any solution to show Captcha in this browser? This is the only obstacle I'm facing.

Thanks! ?

Perhaps don't use a webbrowser?

In an old project, I used webrequests. Parsed the image and displayed it in a picturebox, and took the input from the user and sent that in the next request. It's more efficient.

Yup, I know what you mean, but you're probably talking about this type of Captcha:

While I'm talking about this one:

Thanks for the input though ?
