Thread: [How Encrypt .Net/C# Programme](#)

adenfr - December 25, 2018, 3:30 pm

hello guys

im look for utility.. programe.. encrypter allows you to patch and crypt a program which was coded in .net/C# programming language and avoid decompile or just make it hard

also i here that some programme (encrypter) whene he make the encrypt function ...if you run programme the anti virus consider him as virus

can you helpe to share with me any crypter or patcher to protect my appliction

thanks in advance.

{smartassembly} is a very basic Obfuscator.

Just google .net obfuscators. You will find some.

yes but if some know more he can help or give me an idea like you (smartassembly)

i just i ask to get answer sir

in google there is alot of research but i need explanation from you

and thank to repaly on me

If you want to protect your source code from intellectual property theft, use an obfuscator. You can find them on the internet easily by just typing into google ".NET Obfuscator".

If you want to remove detections from your application, use a crypter. You can probably find them here on HackForums yourself when using the search function with the term "crypter".

Please, for the love of god, don't use an obfuscator to remove detections.

Lync - December 26, 2018, 9:57 am

Be sure to check that the Obfuscator you are using is not supported by De4Dot:

<https://github.com/0xd4d/de4dot>

I suggest <https://netguard.io/>

Paid but also probably one of the simplest ones to reverse based on my experience. Even for open source free tools.

thanks all guys

i really thankfull to all

very thanks to you :)

it's helped

what do you means by saying don't use an obfuscator to remove detections.

It should be obvious that obfuscators make normal looking code a bit more "concerning" for lack of a better term. What do you think a virus scanner will think when looking at code that looks a bit more unfamiliar?
