Thread: [Cert Pinning Web Requests](#)

05317832892 - December 28, 2018, 4:06 am

Having trouble pinning certs on web requests for python 3.

I've tried a lot but nothing is working. I need to get the SSL fingerprint before communicating.

It's to stop tampering with fiddler right now. I want to ignore the system CA trust chain and just verify the hash of the cert incoming in python myself.

Done lots of googling but I can't seem to find any solutions to this.

If you can use python2.x there is this module which is exactly what you're looking for

<https://pypi.org/project/M2Crypto/>

Sadly not supported by python3 and I don't know a similar module for it. Still possible just no so quick and easy

Yeah that look good but I got a solution finally.

Requests has a TrustEnvironment = False thingy and it works perfectly.
