Thread: [Hosting Python files without framework - how far can you go?](#)

Red-Leonard - December 28, 2018, 5:15 pm

I'm trying to get some python files working on my server/host but can't seem to get much done without using a framework

so, how complex can you get without using Flask or Django?

at the moment, anything other than basic text or sums doesn't seem to work on the web

Python comes with a very simple http server, does this work for you?

<https://docs.python.org/2/library/simplehttpserver.html>

It is not meant for production but I am not sure what you really want to do anyways

you can handle http requests with a socket

check this:

<https://tools.ietf.org/html/rfc2616> Hypertext Transfer Protocol -- HTTP/1.1

are_you_here - December 30, 2018, 10:10 pm

You can use the Http request ,
the Get Data can get args ,
from this args you can run it on you server side. /VPS/..

ok, thanks, but how to run it server side?

I mean, I have a windows server and it was a major hassle just getting 'hello world' up and running - is it worth changing server, persevering with windows, or possibly using node.js (which has easy install with server) instead?

Node.js is really easy to setup and you should probably use it if you aren't going to use flask

Sure, Node works, but if you're using it just because some hipster developer said it's the future, I would make the case you haven't weighed your options.

thanks for the replies,

think I'll stick with Flask for now

will prob make a thread in the 'database' section soon, as I'm a little stuck on making changes to that right now....
