Thread: [Setoolkit problem](#)

exatio - January 2, 2019, 1:05 pm

Hello, I tried to use setoolkit in clone site, and I had the error "[!] Something went wrong, printing the error: No module named pexpect". I did : pip install pexpect and it was OK. Now I have the error "[!] Something went wrong, printing the error: No module named ptyprocess"

I do : "pip install ptyprocess"

I have : "Requirement already satisfied: ptyprocess in /home/exatio/.local/lib/python2.7/site-packages (0.6.0)"

But when i want to launch the site cloner, i still have the same error. What can I do ?

Sorry for my bad English. I am French

OS ?

Can you try installing directly the module from this link?

<https://files.pythonhosted.org/packages/7d/2d/e4b8733cf79b7309d84c9081a4ab558c89d8c89da5961bf4ddb050ca1ce0/ptyprocess-0.6.0.tar.gz>

To exclude problem with dependencies and Pip.

Also take a look here:

<https://maissecuritty.blogspot.com/2016/08/setoolkit-ubuntu-something-went-wrong.html?m=1>
