Thread: [Cant restore in itunes, boot loop/blackscreen/recovery mode](#)

'SVEN™ - January 3, 2019, 7:25 am

I got an iPhone 6s, it's not jailbroken or anything. I havn't dropped it on so no fall damage.

The screen turns on i see the apple logo for a couple of seconds after that the screen turns black and stays black you can see it's still powered. After a while it turns off and whenever i try to use a official .ipsw it dosent restore so I have been doing a lot of things.

1. Turn off all anti-virus/malware including windows defender.
2. Added Itunes and Bonjour to the firewall.
3. Turned off windows firewall entirely
4. Deleted all previous ipsw files and tried to use a fresh one if 'file' was potentially damaged.
5. Tried all different usb ports, first off from the keyboard acting as a 'hub' and also all the USB ports in the back panel, even removed all other USB so it wont conflict only keyboard and mouse usbs where used.
5. The USB cable i use is all original coming from Apple itself, the one that came with the box.
6. I've tried to reinstall itunes.
7. Tried DFU mode, recovery mode and whatsoever.
8. I've also turned off energy saving in device manager for USB.
9. Reboot my system a couple of times even a complete shutdown.
10. Stopped Apple Mobile services, and started it all again with a system reboot and tried to use iTunes again.
11. Tried to get another software instead of iTunes, but none of them are free so havn't been able to use it.
12. Checked in device manager while trying to update the phone, it connects and disconnects a several times ONLY when updating. I see the drivers dissapear and appear again.
13. When set to recovery mode I see 3 USB-drivers active, the iBoot driver disapears and I can only se 2 instances of Apple Device USB driver, so im thinking it may be my computer having trouble communicating through USB and therefore it could maybe be my computer thats the problem.
14. I've also searched on how you can fix the USB so it dosen't connect and disconnect and about uninstalling and reinstalling drivers for USB and so on.

I think i sum everything up here what I've been doing and trying so far. Also checked ALOT of information 6+ hours trying to figure this out.

Last option would be to return it so they would check the hardware and mayne repair it.

Thanks in advance and I hope you have some kind of tips on how to actually fix this problem

Any help? Trying to manually crack Dr Fone, IOS Repairment kit.

Tried to deobfuscate it and use net reflector to find if I can bypass the activation somehow. I've read somewhere that people got it working with this application also saw some videos on youtube, would love to get some help.

Hi Sven,

Lets try to help you get your iPhone back up and running!

Please note that Dr.Fone is not better than iTunes when it comes to restoring, so please don't bother.

First of all, please answer if you've ever replaced some part of this iPhone like the LCD, battery, some sensors etc?

Hi, according to your situation, maybe you need a repair tool. I have used such a tool called Joyoshare UltFix to fix my iPhone X black screen. It is said that this kind of software can repair various iOS issues without losing data. So I have a try. Mercifully, it successfully gets my iPhone X repair. Hope it can help you as well. Good luck!
