Thread: [Auto Updater](#)

KyFu - January 7, 2019, 8:55 pm

What would be the best way to include an updater built into the program?

I started developing a second form, but it just hangs when it tries to call to server and detect a version change, so is there another way I can go about this? Thanks in advance ?

Code public static string Version = "VersionNumber";

Code Why do it so complex when its this simple

```
public static void UpdateOrNuh()
{
    if (Version != new WebClient().DownloadString("Website.com/VersionNumber.txt"))
    {
        Console.WriteLine("An Update For The Tool Has Been Found, Will Start Download
Now!");
        Process.Start("LinkToDownloadTheFileForUpdate");
        //If you wanna kill the process to force update
        Process.GetCurrentProcess().Kill();
    }
}
```
