Thread: [Embedding a DLL into a spesific exe in c#](#)

HardStoN - January 19, 2019, 5:38 am

how do i create a dll to spesific exe (I already have an injector) using c#

example: Injecting a dll into notepad. and when i press f then some form will popup.

Thanks for all the helpers

If you inject a dll into notepad nothing will produce because the dll is never call by other program.

To do what you want you require c++, either the entire "f then some form will popup" code or a wrapper that initializes and runs the actual .NET code.

You don't know about code injection clearly.

It does not require C++ (or C for that matter), those are just common languages for this type of thing because they are languages that traditionally compile down to native code. P/Invoke does exist, and there are blittable types.

I don't know why all these types of threads are seemingly always created by people that can't spell, and answered by people who don't know much on the topic.

It could be any number of things, injecting a call to LoadLibrary or something similar to it, or manually mapping the dll in memory. Either way you have no context to make this kind of statement:
