Thread: [VB need help simulating a keypress or keydown event on a webbrowser element](#)

ChristmasNoob - January 20, 2019, 12:35 pm

ok so im making a follow bot but i need help simulating a keypress or keydown or some kind of typing simulation event on a webbrowser id element so that when i login the preset text "place email here" resets

<https://gyazo.com/acf536631c5b0d662ef665f775966c87>

You should be able to get the element by ID, and then put your desired text or variable in there..For example

```
Code wb.Document.GetElementById("username").SetAttribute("value", txtEmail.text)
```

and then you can press the Login button once again by getting the element ID and then pressing the button

```
Code For Each element As HtmlElement In wb.Document.GetElementsByTagName("a")
```

```
If element.GetAttribute("id") = "commentPost" Then
```

```
element.InvokeMember("click")
```

```
Exit For
```

```
End If
```

```
Next
```

you will need to edit the GetElementById tags above to go with your own form. Hope it helps with what you're trying to do..
