Thread: [Using functions in a namespace from a DLL?](#)

Ajumma - January 25, 2019, 1:43 pm

Here is what the class looks like from the DLL when browse it :

This is what the documentation shows from where I got the DLL from:

How do you use this? I tried doing something like :

```
Code Imports Gds.GoogleMap.UltimatePlus.Math
```

```
Dim MeService As MathService
```

```
Dim locate As Point
```

```
locate = svc.ConvertLatLngToPoint(New LatLng(e.Location.Lat, e.Location.Lng))
```

This keeps giving me an error saying that MeService is used before it's been assigned. I don't think its even supposed to be assigned anything?

Help a noob out?

"this keeps giving me an error saying that MeService is used before it's been assigned"

You need to declare properly.

```
Dim MeService As new MathService
```

You need to declare properly.

```
Dim MeService As new MathService
```

I already tried that, the error for that is: Overload resolution failed because no 'New' is accessible.

```
Code Dim MeService As New MathService
```

```
Dim locate As Point
```

```
locate = svc.ConvertLatLngToPoint(New LatLng(e.Location.Lat, e.Location.Lng))
```
