help me

Nope. Not saying it isn't allowed, just saying I have not seen any good service or answer yet.

I believe the reason to this is because of how transparent Java is and making it hard to evade
Google Play Protect. You can only do so much with obfuscating and encrypting the payload seeing
on as its all in Java.

I've always thought it would be a cool idea to have a watch dog type of a thing that works as a
secondary hidden application to use to uninstall/update client, and also used as a stub to decrypt
your payload application, could be quite useful. Although the problem with this is when you require
different permissions for the same binded application it causes lots of issues with most security. So
the only way my idea would be possible is if the client installed 2 separate applications essentially

which would be useless :/

Still expanding the idea but people are welcome to add their input!

Can you help me .apk crypt?
easy u can do it yourself

lathack - June 18, 2019, 9:46 am

PM me who know how to do it asap

xeonhunt009 - June 18, 2019, 10:00 am

Crypting android rat is not that easy... we do not have apk cryptors available, if you find one do let me know as well

Bro , I am using apktool to make some crypted file

It can bypass Google protect easily ,
.but it's really near to impossible to Bypass some best security software of Xiaomi security or vivo iCloud ..

Any help or suggestions is appreciated..
