Thread: [Send fake mail to inbox.](#)

hack3rcon - February 19, 2019, 3:50 am

Hello.

How can I send a fake email to the inbox? Any website or code? I used "emkei.cz" and "deadfake dot com" but emails not received.

Thank you.

Hoodie+ - February 19, 2019, 6:12 am

The emails are received but they are moved to the spam folder because they are most likely potential spam.

Also, even if spoof mail lots of email agents will tell the user that the email may not have been sent from the sender.

I sell a software to do that. Check my signature.

Fake emails will go to spam in any decent email service.

There are Php Scripts. you need to have own domain for that

hack3rcon - February 22, 2019, 10:30 pm

I used below code but sender is "apache@localhost.localdomain":

Code <?php

if (!isset(\$_POST["submit"])) { ?>

```
<form method="post" action="<?php echo $_SERVER["PHP_SELF"];?>">
```

```
To: <input type="text" name="to_email"><br>
```

```
From: <input type="text" name="from_email"><br>
```

```
Subject: <input type="text" name="subject"><br>
```

```
Message: <textarea rows="10" cols="20" name="message"></textarea><br>
```

```
<input type="submit" name="submit" value="Send Email">
```

```
</form>
```

```
<?php
```

```
} else {
```

```
if (isset($_POST["to_email"])) {
```

```
    $to_email = $_POST["to_email"];
```

```
    $from_email = $_POST["from_email"];
```

```
    $subject = $_POST["subject"];
```

```
$body = $_POST["message"];

if ( mail($to_email, $subject, $body, $headers)) {
    echo("Email successfully sent to $to_email...");
} else {
    echo("Email sending failed...");
}
}
}
?>
```
