Thread: [Taking precaution and staying anon](#)

Frxdm - February 21, 2019, 6:17 pm

I have a few questions i would like to ask if anyone could help me out it would be great. I wanna start getting into researching security and hacking in general not anything illegal. I wanna know the basic like, do i buy a seperate computer for it, or do i use a usb, a cd, i use a vpn but please let me know what other steps i should do or any other programs or tools ect. that can help me keep safe from viruses in general and other things like that. any tips or programs or anything like that let me know ?

Get yourself Norton Antivirus, kept me virus free forever.

Cocaine - February 21, 2019, 7:41 pm

Keep yourself hidden if you plan on doing anything you feel is punishable by the authorities. First step in protecting yourself is a good VPN. Then you will need a good proxy if your performing very blackhat tasks. Tor browser is good to use as well. It keeps you hidden on other levels.

Don't ever use your real name/e-mail/info anywhere online is also a good one.

vanishers - October 5, 2023, 5:09 pm

how do i delete a older identity i have created?

Qijes2 - April 15, 2024, 12:53 pm

whats the best oppsec guide 2024?

meatyklackers - April 15, 2024, 7:57 pm

I would suggest using a VPN that doesn't keep logs (free means garbage). Have like 30 identities so that they can't tie you to other forums, accounts etc. Anything to keep yourself anon. Using Kali linux within a virtual environment is a good way to keep yourself protected as well. Also, wear a tin foil hat....not because it protects....because it looks fucking rad!

if you are scared of viruses and dont feel like getting a new pc, i would just say to go with vmware or virtualbox as 1.if u get infected with malware, it wont be connected to your pc and 2. u can turn it on and off whenever u want.

KALI LINUX IS BEST BECAUSE IT CONTAINS MOST OF THE SOFTWARES AND STUFF YOU CAN USE TO LEARN.

search up on youtube how to set up a metasploitable so that u can learn everything u want and

pentest your own server :)

Hi First of all you stop using Google services it tracks you and start a browser using like duckduckgo or brave and clear all your history and cookies as well or you need more security than go for N-o-r-d VPN or tor browser or you need more advanced then start using tails or qubes os
