Thread: [Check if username and password exists in txt file](#)

Formula 1 - February 27, 2019, 1:39 pm

Hello,

How can i check if username and password exists in txt file?

Text file looks like that:

```
username1:password1  
username2:password2
```

I want it to read each line... not only the first line

You should be using the count parameter in one of the overloads of the Split() method to avoid it splitting the pair into more than 2 chunks in case a password contains the ":" delimiter. NO idea why you're using LINQ here though... ? You can index arrays and they also have a Length property you can check to avoid the index out of range exception.
