Thread: [Dead Crypters - bringing them back to Undetectable](#)

TetraHC - March 11, 2019, 9:48 am

Before i start i dont 100% know what im talking about so apologies if i sound like a total skid thats why im here i want to know about this method and could possibly save myself monthly fees for a crypter,

Theres a guy on here i recieved a crypter from him he seems to know his shit by looks of it hes tried to explain how to do this method of splitting the files and editing them in hex once youve crypted your server with stub file, editing characters to capital changing them whatever so playing about in hex with any characters that may flag up av, dont reply to me saying "this aint 2005" this shit is being done so ive been told, what im basically looking for is a video tutorial or easily explained guided method on this here

<https://hackforums.net/showthread.php?tid=2146760>

MY idea was to add server to crypter application crypt it with stub and if its coming out detected split the file up and open the split files which are being detected, open them in hex and edit the characters a little that deem to flag up av play around abit until it its Undetectable

Much appreciated if someone can help a noob out with this ?

This thread Imfao.. I dunno if hex editor is gonna help you during runtime xddd

g3ntl3m4n - March 13, 2019, 1:41 am

Very old method maybe you can clean some scantime but runtime wont do the job...

Gonna need a lot more than a hex editor to make a old crypter UD again.
