Thread: [BIOS removing password.](#)

dumbme - March 18, 2019, 10:21 am

Hi, Does anyone here know how to get rid of a password for a Insyde H20 bios version A09 ?

I tried everything, it's a MX14 Alienware laptop, but removing the battery doesn't work. I also can't update the bios because the battery is down.

If someone could help me on that, I would love it.

System Disable 55FFCD1B8DA68E54

Service Tag C131VY1

I don't know if this is usefull to found out but I heard that could. What's are my options ? Because I saw some people might be able to hack it in someway by giving those numbers and letters, but they require payment...and i'm not sure if that will work.

Thanks for your answers.

Maybe this an help.

<https://bios-pw.org>

Other thing is maybe you have to short some pins for it to reset. I am at work right now, maybe later i will check this specific laptop.

Hmm, just take open the back of the laptop, find the CMOS and take any metallic object to short the pins (Use a jumper if you have one, I don't). I'm not sure about laptops, but that jolly well works for PC towers.
