Thread: [Bridged Kali interface in Microsoft NAP environment - Need help](#)

**SlavedWizard** - March 18, 2019, 11:16 am

Hi folx, in brief... i have physical access to windows workstation machine authorised in vlan by windows server NAP.

Is there bypass that i can use to get my bridged NIC in kali virtual box so it gets connected to network without deauth from NAP? Like for now, when i boot up my vbox kali im losing connection to vlan on my host win 10 machine, physical network card gives me status - cable disconnected, and i have to reboot win to get connection back.

Any advice will be appreciated.

hmm seems that for some reason the NAP doesn't like whatever you are doing. It could be multiple things on your machine you should have an "agent" checking the "health" of the machine (the agent polls the machine for "SHA" , basically making sure that the box is compliant. My thought is that when you run the VM you are routing through the host OS (the one that has the agent all that jazz) anyhow be it traffic coming from the VM is not compliant. Figure out what's breaking and upsetting the agent on your host.
