Thread: [Current State of Nintendo Switch MitM Attempts](#)

LegendBegins - April 1, 2019, 7:28 pm

Hello all,

For those of you in the Nintendo Switch hacking scene, I was wondering if any of you had some info on whether there has been any development in the works on installing a Certificate Authority onto a rooted Switch. I'm looking into installing a personal cert to sniff communications, but haven't found any info on whether that process has been refined (or even started) yet.

Mouse.103 - April 8, 2019, 5:41 pm

I am in switch hacking scene and I know some people are doing this cert thing to unban their console.

I think you would be referring to the console certificate, being what Nintendo checks on their CDN. I mean a root CA certificate, which would allow us to decrypt communications between the Switch and the server it connects to (and any other clients it starts a P2P connection with).

Hello, everyone, I am new over here. I want to open with you all.

I am Geraldine and like to play a video game in my meantime. Well, I am a console gamer, but never played on the Nintendo.

Just for the curiosity what other game are you all playing?
