Thread: [Way more BSOD with update 1809](#)

Goku - April 4, 2019, 10:19 pm

Have you guys also noticed way more BSOD with the latest insiders update in the slow ring? And no I don't mean 1 in a day but multiple in a day.

f1re_w1re - April 7, 2019, 9:23 pm

I havent noticed. Unfortunate, the latest version of Windows and the latest version of Kaspersky FDE do not like each other. Which is what's plaguing our company right now. Have you dissected the full memory dump with the Windows Drivers Kit to see what the problem is?

webdev77 - April 8, 2019, 4:29 pm

There is a good chance you have a GPU driver problem. Without knowing the error though, we can't help you.

?Apocalypse - April 8, 2019, 4:32 pm

The only thing I get after 1809 is MBR repair at start-up always pops up.

Looks like I need a fresh installation.

LinK - April 8, 2019, 8:19 pm

I completely wiped my Windows install and went to Ubuntu full time because of these problems. They are a bother.

It did an SFC scan and the results came with some critical errors which couldn't be solved. after using memtest86 to check my CPU and memory I got 140+ errors on my CPU and after running Windows Memory Diagnostic it said that I should contact the manufacturer because there is something wrong with my ram and or cpu...

I'm so screwed...

Also this an error code that pop-up'd while doing the scan.

error 0xc0020036

My last hope is doing a fresh install and I really hope the BSOD and errors are gone.

Try reinstalling without removing your existing files. You can use this to view the minidumps from BSODs which will make it easier to diagnose

SIM-2470866 - April 9, 2019, 3:35 pm

I had to downgrade to windows 8. The new update was fucking up with my CPU usage hence why I was getting low FPS on most of the games.

The CryptivSVC was the problem (its pretty known to 1809)

Thank you! Yes gonna do that and hope for the best

gianni - April 9, 2019, 3:37 pm

I have never BSOD'd on the newest windows update other than when I was using a cheat that had a bad driver.
