Thread: [Disable Double Click to Full Screen](#)

Snow - April 20, 2019, 1:13 am

First off thank you for taking the time to read my thread. I also know this may be in the wrong section but it is 4am here.

So on alot of websites if I double click the video full screens. Is there a way to disable this

I use a plugin on chrome

<https://chrome.google.com/webstore/detail/fullscreen-anything/olcfgpmjldkkjdclidhcbonieibfhhdh?hl=en>

Essentially it is a plugin that allows me to full screen anything in my browser. The reason this is so useful for me is because I have a 34 inch wide screen curved monitor. So actually full screening something to the entire monitor is pointless due to the resolution being at 344x1440. But when using this plugin if I click on the screen while in full screen browser mode and I attempt to pause and resume it registers it as a double click and full screens it to the entire size of the monitor. So normally that wouldn't be a big deal but I am hosting the movie and streaming with others so it glitches out and then they are no longer able to see it which leads to having to restart the stream. Obviously I could find a way to modify the plugin or use a different streaming service. But the most practical and easy solution in my opinion would be to see if there is a simple way to disable the double click full screen within my web browser.

Thanks you ?

Don't double click the video? Did you consider that.
